

Test

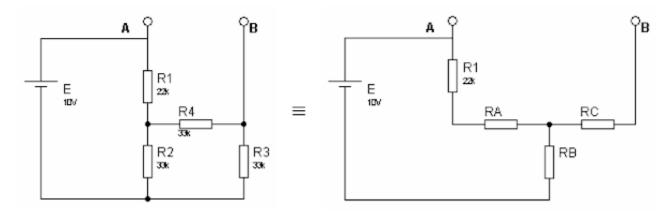

Exercice

1-Déterminer les caractéristiques E_T et R_T du générateur de Thévenin équivalent au circuit suivant 2-Trouvez la valeur de courant I circulant dans la Résistance R=22K:

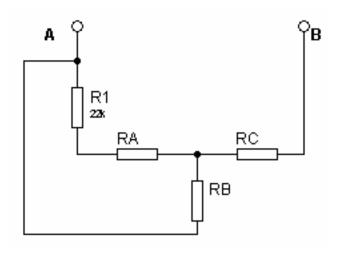

Solution

1. on calcule Eth = UAB

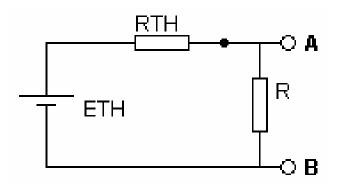

On utilise la transformation triangle-étoile. Puisque R2 = R3 = R4 = 33k, RA = RB = RC = 33k / 3 = 11k $Eth = UAB = E \times (R1 + RA) / (R1 + RA + RB) = 10V \times (22k + 11k) / (22k + 11k + 11k) = 7,5V$

2. on calcule Rth = RAB

 $Rth = RAB = [(R1 + RA) \ / / \ RB] + RC = 33k \ / / \ 11k + 11k = 19,25k$

3.

I = Eth / (Rth + R)

I=7,5/(19.25+22) I=0.18mA
